                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             윱
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           This sequence is a fusion protein of HLM and Jun. The invention cleares to a method of forming a cysteine knot protein (i) having alpha careliates to a method of forming a cysteine knot protein (ii) having alpha can beta -subunits comprising attaching a dimerisation domain (DD) to either the Wremania of both subunits or the Wremania of the cather the Cremania of the beta-subunit and dimerising the products to form a heterodimeric protein andlog (II). The method is the products to form a heterodimeric protein andlog (II). The method is cleared to produce analogues (sgonists or antagonists) of deglycosylated glycoprotein hormones, potentially useful. e.g. for treating infertility where caused by polycystic ovarian disease (associated with excessive the as immunogenes or antigens (since a bo may containing highly antigenic and manuogenes or antigens (since a bo may containing highly antigenic cannon acid sequences). Attachment of a bo (which may be removed later) facilitates the formation of heterodimers, that have similar structures and allows the combination of subunits that would otherwise combines, and allows the combination of subunits that would otherwise combines. Company of subunities that would otherwise combines to company of subunities that would otherwise combines.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                   Cysteine knot protein; protein formation; heterodimeric protein analog; deglycosylated glycoprotein hormone; infertility; immunogen; antigen; polycystic ovarian disease; hGG; human; chorionic gonadotrophin; beta subunit; therapy; Jun.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Methods for producing heterodimers, particularly analogues of hormones, from subunits of cysteine knot proteins -

The invention relates to human single chain forms of the glycoprotein charmone quarter which is an agonist or antagonist of lutterinists hormone content which is an agonist or antagonist of lutterinists hormone (TH), follicle stimulating hormone (FSH), thyroid stimulating hormone (TSH), thyroid stimulating hormone (TSH), thyroid stimulating hormone (TSH), thyroid stimulating hormones are beterodimers or forms of single chain hormones are used in treating infertility, as aids in vivro fertilisation techniques, and other therapeutic methods in vivro fertilisation techniques. And other therapeutic methods or associated with the mative hormones. The single chain hormones are useful as research of antibodies with respect to the native proteins in bological samples, as control respects, as disquastic tools to cetect the presence of antibodies with respect to the native proteins in bological samples, as control respects in detecting and purifying creeptors to which the native hormones bind. The single chain hormones are used as purification tools for subsequent preparations of these meterials and to monitor clavels of single chain hormones administered as drugs. The single chain of subsequent preparations of these meterials and to monitor of subsequent preparations of these meterials and to monitor of subsequent preparations of these meterials and to monitor of subsequent preparations specifically immunoreactive cutth these new compounds, as substitutes for the heterodiments forms of hormones. The present sequence is human single chain gonadotropin
                                                                                                                                                                                                                                                                                                                                                                                           121.134
/note- "Corresponds to 95-108 amino acids of human follicle stimulating hormone (FSH) beta-subunit*
135.142
/note- "Laturer peptide"
143.234
/note- "Corresponds to 1-92 amino acids of human slugle chain gonadotropin alpha-subunit*
                                                                                                         Human; single chain gonadotropin analog no:7; anti-infertility; drug; peptide therapy; lutefathising hormone; IH; follicle stimulating hormone; FSH; thyroid stimulating hormone; TSH; chorionic gonadotropin; CG; glycoprotein; infertility; fusion protein.
                                                                                                                                                                                                                                                                                                                   /note-*Corresponds to 1-100 amino acids of human chorionic gonadotropin (CG) beta-subunit*
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New DNA or RNA encoding single chain protein useful in treating infortility, as aids in vitro fertilization techniques, or other therapeutic methods associated with the native hormones

         The sequence represents the amino acid sequence of single chain gonadortopin nanloque #7. The giveportoein homome analogue #8. The giveportoein homome analogue is conductorpin analogue #8. The giveportoein homome analogue is conducted analogue #8. The giveportoein homome analogue with new compounds, as a substitute for the heterodinaric forms of the homomes, in the treatment of infortility as an aid for in vivo fertilisation con techniques, and in other therapoutic methods associated with the native portions are regert in a manner similar to the heterodinar, as a dispositic tool to detect the presence of antibodies with respect to the native proteins in the presence of antibodies with respect to the native proteins in the levels of these homomes in various samples, and in detecting and to puritying receptors to which the native homomes bind. The single chain forms of the heterodinars to honodinars have the following advantages over their dimeric forms: they are more stable, problems of recombinant production are reduced since only a single gene is needed to transcribe, translate and process, provide an alternate form thus permitting fine tuning of activity levels and of in vivo half lives. Single chain forms are unique starting materials for identifying truncated forms with the protein to be engineered without disturbing the overall folding of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                    New single chain forms of the glycoprotein hormone quartet useful for generating antibodies specifically immunoreactive with the new compounds, in treating infertility, or as aids for in vivo fertilization techniques

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The single-chain gonadotropin analogue 3a (human LH-beta(1-114) (MSM)-linker-human GG-alpha(1-92) (MSM) can be derived from analogue 3 by removing at least one of the glycosylation sites. The partially deglycosylated analogue has anti-lutefinisting hormone (lutropin) activity and can be used for facilitating hormative, terminating pregnancy and reducing analogue secretion.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Location/Qualifiers

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ò
                                                                                                                                                                                                                                                                                                                                                                                                                   ö
analog no:7 related to the invention. Analog no:7 is a fusion protein consisting of human chorinci organdorroul (GG) beta subunit (1.100 amino acids) and follicle stimulating hormone (RSH) beta subunit (9-108 amino acids) fused to human single chain gonadorroph alpha subunit (1.92 amino acids) Ar a linker sequence. This analog serves as a useful starting momender compound for remplate directed vaccine design and for the development of hormone-specific vaccines for use in humans.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      1..20

The sequence is an analogue of mature hCG beta subunit having several residues replaced by the corresponding residues in the bovine LH protein and residues 23-145 deleted. The chimeric hormone may be useful for identifying residues which are important for binding to the human receptor and may also have applications as an immunogen, apoints and/or antagonist.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Opery Match 70.7%; Score 549.5; DB 12; Length 122; Best Local Similarity 78.1%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to human single chain forms of the glycoprotein formone quartet which is an agonist or antagonist of intellating hormone conformed quartet which is an agonist or antagonist of intellating hormone (18), follicle stimulating hormone (18), follicle stimulating hormone are agonist or encloned standard properties of the stimulating hormone are used to the standard alpha bormones are add in the subunits. The agonist forms of single chain hormones are used in trendentic methods associated with the native hormones. The single chain hormone are useful as reagents in a manner similar to heterodimera, as dispossit tools to detect the presence of antibodies with respect to the native proteins in biological samples, as control reagents in assay kits for assessing the cereptora to which the native hormones blud, the single chain hormones respinance of antibodies with respect to the native proteins in biological samples, as control reagents in assay kits for assessing the cereptora to which the native hormones blud, the single chain hormones are also used in affinity chromatographic preparation of receptors or antibonemy and proteins of antibodies. They are used as purification tools for solution of aubsequent preparations of these materials and to monitor levels of single chain hormones administered as purificating immunoracity of human single chain hormones administered as furge. The single chain of human single chain manner of hormones. The present sequence is human single chain or as a useful candog on: as a single than or and antipodical specific vaccines for use in humans. Consisting or human single chain genedotropin appression or human single chain genedote accide) by a linker sequence. This analog serves as a useful exectlopment of human large chain genedotropin apples submit (1-19 amino acide) by a linker sequence. This analog serves as a useful exectlopment of human single chain genedotropin apples submit (1-19 amino acide) by a linker sequence. This analog serves as a useful search sequence i
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The sequence represents the amino acid sequence of single chain good additional analogue 16. The givectoreden homeone analogue 18. The givectoreden homeone analogue 18. Condedtropin analogue 16. The givectoreden homeone analogue 18. Condedtropin analogue 18. The givectoreden homeone and the condedtropin analogue 18. The sequence of the condedtropin and the retraction of the chain profess an analogue of the homeone. The single chain profess as a dispose of the native hormone. The single chain profess is a disposet to the native protein in a character in the condess of antibodies with respect to the native proteins in the broadge of antibodies with respect to the native proteins in the conditional condess of antibodies with respect to the native proteins in the broadge of antibodies with respect to the native proteins in the presence of antibodies with respect to the native proteins in the presence of antibodies with respect to the native proteins in the proteins of recording to which the fative homeones bind. The single chain comes of the heterodianes or homeofamers have the following advantages over that dimeric forms: they are more stable, problems of recombinant production are reduced since only a single spen is needed to transcribe, trainate and process, provide an alternate form thus permitting fine tuning of activity levels and of in vivo half lives. Single chain forms are unique starting analorism for identifying truncated forms with the cativity of the dimer. The linkage between the subunits permits the protein to be engineered without disturbing the overall folding of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New single chain forms of the glycoprotein hormone quartet useful for generating antibodies specifically immunoreactive with the new compounds, in treating infertility, or as aids for in vivo fertilization techniques
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Query Match 70.7%: Score 549; DB 22; Length 237;

```

The invention relates to human single chain forms of the glycoprotein hormone quartet which is an agonist or artagonist of lutefulsing hormone (LH), follicle stimulating hormone (FSH), thyroid stimulating hormone (TSH), thy or chorionic gonadokropin (GG). All these hormones are heterodimers

Addition of oligosaccharides has a positive effect on stability of hormones in circulation and can be used to present unwanted antibody or receptor interactions. The present analogue has anti-follicle stimulating hormone (follitropin and and and and and anti-lutenising hormone (follitropin) and cautiful for treating ovarian hyperstimulation and reducing spermatogenesis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           /note- "wild-type Pro at position 78 of the beta-

having identical alpha subunits and differing beta subunits. The agonist forms of single chain hormones are used in treating intertility, as aids can vitro fertilisation techniques, and other therapeutic methods associated with the native hormones. The single chain hormones are useful cassociated with the native hormones. The single chain hormones are useful cast reagants in a manner similar to heterodimers, as diagnostic tools to detect the presence of antibodies with respect to the native proteins in the biological samples, as control reagents in assay kits for assessing the biological samples, as control reagents in assay kits for assessing the creeptors to which the native hormones blind the single chain hormones antibodies. They are used as purification to receptors or antihomone antibodies the hormones and the constructions of these materials and to monitor levels of single chain hormones antibodies specifically manuforeactive with these now compounds, as substitutes for the heterodimeric forms of chain on ordinate as substitutes for the heterodimeric forms of caston protein consistant of human chorionic gonadocropin (CC) beta subunit (1:100 manno acids) and follicle stimulating hormone (18) lines of subunit (1:100 manno acids) and follicle stimulating hormone (18) and a sequence. This analog serves to subunit (35:11) anino acids) fused to human single chain gonadocropin of the new accurace. This analog serves to subunit (35:11) anino acids) its as inhere accurace. This analog serves to consist starting compound for template directed vaccine design and consistence of the subunit of the humans.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ;

The sequence represents the amino acid sequence of human luteinising characters subunit, amino acids lill. The protein is an anomone beta subunit, amino acids lill. The protein is an anomone beta subunit and the protein hormone heterodimer, along with chorionic gonador or proper certain hormone heterodimer, along with chorionic gonador or proper protein hormone fresh, thyroid stimulating control or protein the protein are useful for generating but differing beta subunits. The proteins are useful for generating but differing beta subunits. With the native hormones, in the treatment of intertility, as the encodiment forms of the hormones, in the treatment of intertility, as cateful for in two fertilisation techniques, and in other therapeutic cateful that the native hormones. The single chain proteins as diagnostic tools to detect the presence of antibodies with respect to the native hormones and in detecting and purifying receptors to which the native hormones can did nother bornones and in detecting and purifying receptors to which the native hormones to hind. The single chain forms of these hormones in various samples, and in detecting and purifying receptors to which the native hormones to hind. The single chain forms of these hormones in the proteins in the proteins in the proteins and in detecting and purifying receptors to which the native hormones control. The single chain forms of these hormones in the proteins in the proteins and the single chain forms of these hormones are proteins in the proteins and in detecting and purifying receptors to which the native hormones control reagents of recombinant production are reduced since only a single gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human; chorionic gonadotropin; hCG; glycoprotein hormone; infertility; luteinisism hormone; Lif; follicle stimulating hormone; PSH; thyroid stimulating hormone; TH.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New single chain forms of the glycoprotein hormone quartet useful for generating antibodies specifically immunoreactive with the new compounds, in treating infertility, or as aids for in vivo fertilization techniques.

                                                                                                                                                                                                                                                                                                                                                                                                                                      A method has been developed for predicting the likely timing of the chast of menopause for a perimenopausal female. The method comprises of obsert of menopause for a perimenopausal female. The method comprises of determining the amount of human luterinising hormone beta core fragment (hilf-beta of in a sample from the subject by: (a) confacting a sample of with an antibody (ab), which specifically blinds to hilf-beta of full beta of hilf-beta of the measuring the amount of hilf-beta of in the sample determined in step (b) with the amount of hilf-beta of in the sample determined in step (b) with the amount of hilf-beta of in the subjects sample and indicates campled. In the known postmenopausal or premenopausal female subject, where an amount of hilf-beta of in the sample similar to the level in the known postmenopausal or premenopausal female subject sample and indicates of hilf-beta of menopause. An hilf-beta of hilf-beta of menopause. An hilf-beta of hilf-beta a temporal distance from the onset of menopausal contacterize hilf-beta a temporal distance from the onset of menopause. An hilf-beta of his been sendoral distance from the onset of menopause of chast been sendoral distance from the onset of menopause of chast been sendoral distance from the onset of menopause of chast beta been sendoral distance from the onset of menopause of chasted from the menopause of the present of the present and in men. The methods can be used to characterize hilf-beta of expression in the urine of both reproductive and perimenopausal female, assessing ovarian function and to determine the effect of predicting the likely timing of the onset of menopause of cor a contacterize hilf-beta effects of the presents and hilf-beta fragment used in the contact of the present invention.
Determination of human luteinising hormone beta core fragment in urine samples, useful for predicting onset of menopause
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human; luteinising hormone; beta core fragment; hLH; menopause;
urine; antibody; hLH-beta cf.

properties, compared to wild type CKGFs, are claimed. The CKGF superfamily comprises at least four families of growth factors: the capperfamily comprises at least four families of growth factors the gly opported in hormones, the platelet-derived growth factor-bally, the charmed mentoric phinis and the transforming growth factor-ball family; the configurate known to be structurally similar (especially comprising the cysticines for topology) and it was shown that mutations at certain of the CKGF superfamily could shown that mutations at certain cartificiantly could significantly alter the biological activities of the CKGF.

The material properfamily could significantly alter the biological care also useful to treat or prevent hypothypicidism (claimed). They can also useful to treat or prevent hypothypicidism (claimed). They mutant heteroclamer or analogue to stimulate iodic superial phinistering the content or analogue to stimulate iodice uptake, and considered and subsequently administering radiolabeled iodine to treat the cancer or enables radiolabel detection (claimed).

is needed to transcribe, translate and process, provide an alternate form thus permitting fine tuning of activity levels and of in vivo half lives. Single chain forms are unique starting materials for identifying truncated forms with the activity of the dimer. The linkage between the subunits permits the protein to be engineered without disturbing the overall folding of the protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   This is the wild type human luteinizing hormone beta subunit. Mutants comprise at least one electrostatic charge altering mutation in a beta hairpin loop, resulting in increased bisoctivity. Mutant cystine Knot growth factor (CKEP) proteins comprising one or more mutant subunits and having novel properties or improved pharmacological
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                human luteinizing hormone; beta subunit; CKGF; mutant;
cystine knot growth factor; hairphi loop; thyroid stimulating hormone;
TSH; hypothyroidism; thyroid cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New mutant cystine knot growth factor proteins comprising one or more matant subunits, vastil for freating or preventing diseases e.g. Mypothyroidism and thyroid concer

```

essential region, a DNA sequence of formula : (Hormone)n; n= 1-20; Hormone- DNA sequence destrived from the sequence encoding a reproductive hormone. The hormone is esp. LH, GnRH, CO Or FSH.

Sequence 141 AA:

Ouery Match 70.0%; Score 544; DB 7; Length 141;
Best Local Similarity 85.1%; Pred. No. 5.44-42;
Matches 97; Conservative 6; Mismatches 11; Indels 0; Gaps

Second 15, Application US/08918288
Patent No. 623889
GEREAL INFORMATION
APPLICAMY: BOTHE ITVING
TITLE OF INVENTION: GINCLE-CHAIN FORMS OF THE
TITLE OF INVENTION: GINCOROTEIN HORMONE QUARTER
NUMBER OF SEQUENCES: 83
CORRESPONDENE ADDRESS:
ADDRESSEE: MORRISON & FORESTER
STREET: 2000 Pennsylvania Avenue, NW, suite 5500
STATE: DC
       SOPTWARE: Patentin Release #1.0, Version #1.25
CURRENT APPLICATION DATA:
APPLICATION NUMBER: US/08/425,673
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    COMPTR: USA

1G-06-709-948-23

Sequence 23, Application US/08709948

Patent No. 5315504

GENERAL INFORMATION

GENERAL INFORMATION

APPLICANT GAllo, Robert C.

APPLICANT ELVANT LINACALISKANDAL TSANDAL

TITLE OF INVENTION: TRANSMALY AND PREVENTION OF HIV INFECTION

TITLE OF INVENTION: BY ADMINISTRATION OF DERIVATIVES OF HUMAN CHORIONIC GONADOT

NUMBER OF SEQUENCES: 26

CORRESPONDENCE ADDRESS:

ADDRESSEE: Fenole & Edmonds LLP

STREET: 1155 Avenue of the Americas

                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Sequence 4, Application US/09146283
Patent No. 5976516
GRERAL INFORMATION
PAPLICANT: LAUS, Reiner.
APPLICANT: RUBGSY, Curits L.
APPLICANT: Mu, Hongru
TITLE OF INVENTION: Immunostimulatory Compositions
NUMBER OF SEQUENCES: 10
CORRESPONDENCES: 10
